

DESCRIPTION OF THE SPECIFIC PREDYKT ADVANTAGES

- **TWO MEASURES AND THE BASIC STRUCTURE IS CALCULATED: TRY IT**
Open the "FOUNDATION" step and enter the length and width of the foundations. This is enough for the software to activate formulas and instantly display the quantities and prices of materials and labor for the foundations, floors, ceilings and exterior walls of all selected stages. The software writes alone and by default all the purchase orders of the project and distributes them to the suppliers concerned. See everything in the file "RESULTS" of the software.
- **CHOICE OF PROJECTS:**
The user chooses among the 15 stages of the project displayed in the table, those which will form the project. He selects the tables of the software to be displayed and completed for each stage of the project. Enter figures or confirm a choice for each box displayed in these tables. For each step to build, see the file "See the takeoff production guide" of the presentation.
- **PROJECTS DISTRIBUTED EVERYWHERE:**
: Order a plan statement (ex: house, duplex, triplex or other) from a Predykt dealer, instantly allows the user to install the project on land and incorporate these products as desired (ex: water inlet, lawn, parking, excavation and others), to confirm its choice of products (ex: bricks or aluminum) and to activate its local price. The software via the internet transfers by default the prices of the products of its suppliers, submits a funding request to a banking institution and distributes project purchase orders to each registered supplier.
- **ESTIMATOR USED ONCE ONLY:**
Significantly reduces the use of estimators to produce project takeoffs. The multiple reuse of the same project on other sites reduces to zero the use of estimator to manage these same projects.
1 project = 1 estimator = 1 project director
10 identical projects = 0 estimator and no cost = 1 Director for each project
- **ALL PROJECT PRODUCTS ARE INTERCHANGEABLE:**
Upon receipt of a project and with just one click, each material and labor product of the project can be added, deleted or modified according to the use of the software options. The prices of the products are adapted to the price list of the software used.
- **PROJECT INSTALLED ON THE GROUND:**
The land options manage the costs not displayed at the start due to ignorance of its location. By activating certain options, the software using this new information determines the excavation, import or export of soil, landscaping, parking, utilities, professional services, taxes and others.
- **TUTORING FOR TRAINING:** Software tutorial displays all on-screen instructions and guides you through the learning process. By following the instructions in the software tutorials, a person with blueprint reading skills can easily and quickly calculate a blueprint takeoff.
- **TRAINING VIDEO:** The software contains videos demonstrating the installation of several categories of products (mineral wool, siding, gypsum, paint, cabinets, etc.). On the software's home page, a black dot is displayed along with a question mark. Click this icon and select a video to watch and listen to.
- **PRICE LIST:** The Predykt price list integrated into the software and updated regularly allows any new project received to keep product prices and the cost of the project up to date. The house price list replaces the Predykt price list by integrating its new prices into the project and stops the counter of the Predykt price list for this project.
- **PURCHASE FORM:** Display all purchase orders using the master price list integrated into the software and updated daily. The master price list modified by the user and adjusted by different suppliers forms a local price list displaying new prices for the project.
- **BANK REPORTS:** The software, via the Internet, sends each targeted banking establishment a financing request displaying the monetary reports of all the detailed products of each product category for examination.
- **QUOTATION:** Propose a quotation from a supplier to replace in a purchase order the detailed compilation calculated by the software of all the products of a category of products of the project.
