- TEST PROGRAMMING

By selecting the displayed steps of the software (9 steps) and entering the measurements (area and perimeter) in the FOUNDATION step, the software activates the queries, installs all the products in each relevant step, writes the results in the purchase orders identified for each product and distributes them electronically to each supplier selected by the user.

- WORK DONE BY A QUERY

A query chooses which steps should be enabled (STEP: foundation as an example), chose which sections will be used (SECTION: exterior wall as an example), chosen which subsection will be used (SUBSECTION: insulation as an example), and chosen which options will be used (OPTION: R-20/16 insulating wool).

- RESULTS FROM ENABLED QUERIES

The software installs the chosen products (R-20/16 insulating wool), chooses which subsections will be used (insulation), chooses which sections will be used (exterior wall) and confirms which steps will be used (1st floor). The software compiles and writes the results of all queries in purchase orders distributed to each supplier selected by the software user

- TEST SUMMARY

Check the 9 stages of the project to be built and enter the two lengths in the FOUNDATION step and instantly the calculation transfers the results to project purchase orders.
